

# Building a Portfolio Website

OCRUG + MAC

Github repo: <https://bit.ly/2U9idNY>

# Agenda

Tutorial ~ 1.5 Hour

Questions ~ 30 mins

# What this is and what this is not

This workshop will give you the tools for a simple, customizable website

Not a deep dive into:

- R
- Git
- Github
- Websites
- Data Science projects

# Motivation

## **Why have a portfolio website?**

One way to build trust with others is to prove you can do the work. In data science, you can show that work by building a portfolio of projects.

## **What to include in your website? (Some ideas)**

School, Hackathon, workshop, competition projects

Code is available and well-documented.

Compelling story

[AwesomeBlogdown](#) is a collection of websites built with Blogdown

# Why Hugo, Github, Blogdown, Netlify?

- **It's free**
- **Simple editing.** Instead of using HTML to write your content, you can write using popular Markdown and LaTeX math expressions.
- **Multiplatform.** Build your site on the cloud or locally on a Mac, Linux, or Windows computer.
- **Lightning fast to generate.** Hugo builds the site, piecing together all the various parts and converting the content to HTML in less than a second
- **Lightning fast to access.** The inherent advantage of using a static site generator is that each page and asset can immediately be served to the client without any dynamic processing.

# Workflow

# Set up

- Git <https://git-scm.com/>
- RStudio
- GitHub Account <https://github.com/>

# Steps

- GitHub
  - Create new Repository
  - Copy/clone url
- R Studio:
  - Install blogdown: `install.packages("blogdown")`
  - `blogdown::install_hugo()`
  - Create new "R Project" -> New Directory -> "Website using blogdown" -> Hugo Theme: Default (can be changed)
  - Serve Site
  - Modify "config.toml" file
  - Addins -> New Post
  - Add, commit and push changes
- Netlify
  - Connect to GitHub and serve site
  - Change domain

# Git

- Need to configure git for first time users

```
$ git config --global user.name "John Doe"
```

```
$ git config --global user.email johndoe@example.com
```

# Github

- Create a new repository

## Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository.](#)

Owner \* Repository name \*

 pablobara ▾ / website1 ✓

Great repository names are short and memorable. Need inspiration? How about [effective-pancake?](#)

Description (optional) 

my Website

☒  **Public**  
Anyone on the internet can see this repository. You choose who can commit.

☐  **Private**  
You choose who can see and commit to this repository.

### Initialize this repository with:

Skip this step if you're importing an existing repository.

☐ **Add a README file**  
This is where you can write a long description for your project. [Learn more.](#)

☒ **Add .gitignore**  
Choose which files not to track from a list of templates. [Learn more.](#)

.gitignore template: None ▾

☐ **Choose a license**  
A license tells others what they can and can't do with your code. [Learn more.](#)

This will set  main as the default branch. Change the default name in your [settings](#).

Create repository

# Github

We will create a local copy of this repository.

Quick setup — if you've done this kind of thing before

Set up in Desktop

or

HTTPS

SSH

`https://github.com/pablobara/webs.git`

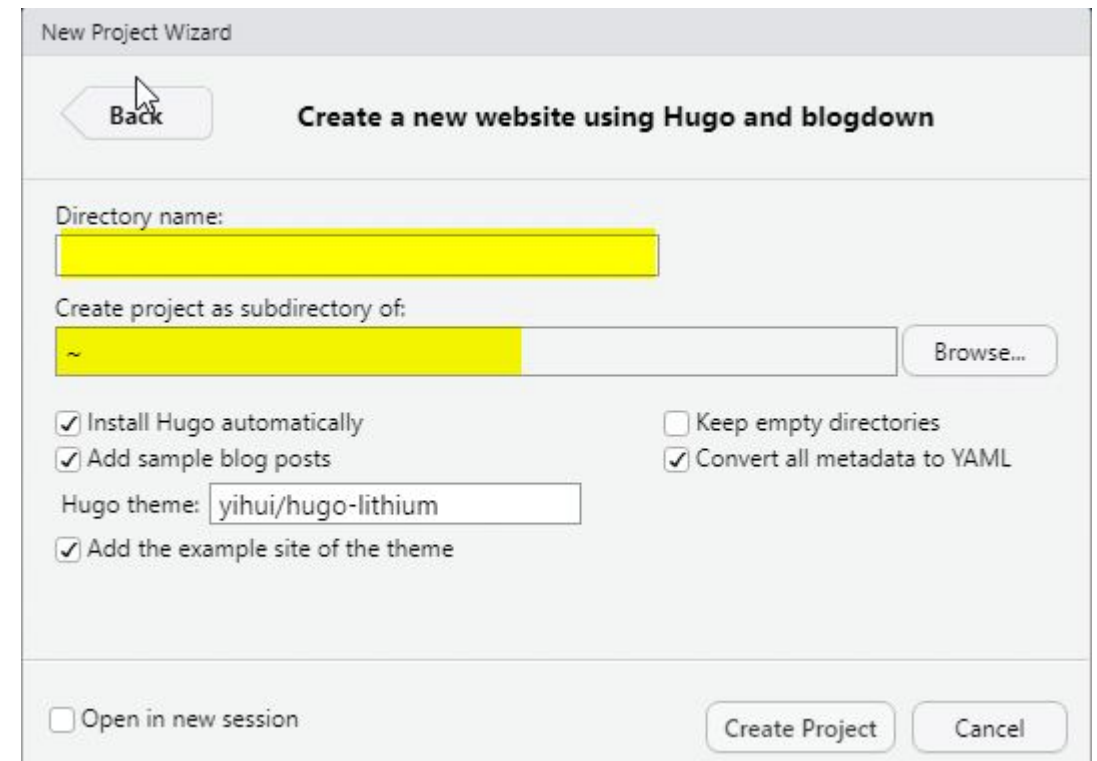

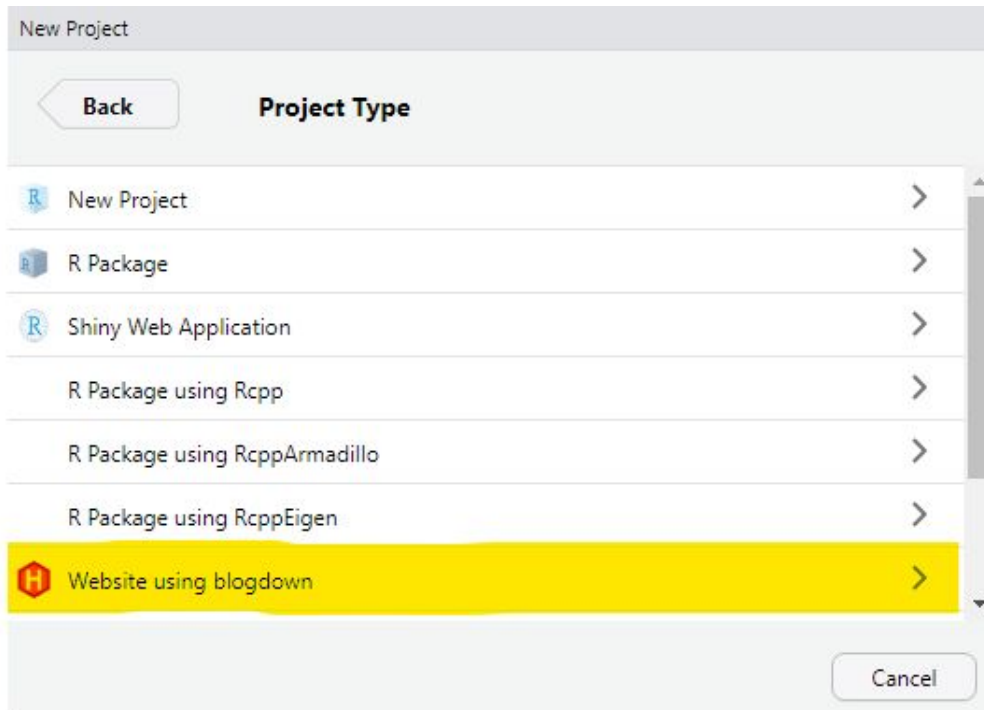

Get started by [creating a new file](#) or [uploading an existing file](#). We recommend every repository include a [README](#), [LICENSE](#), and [.gitignore](#).

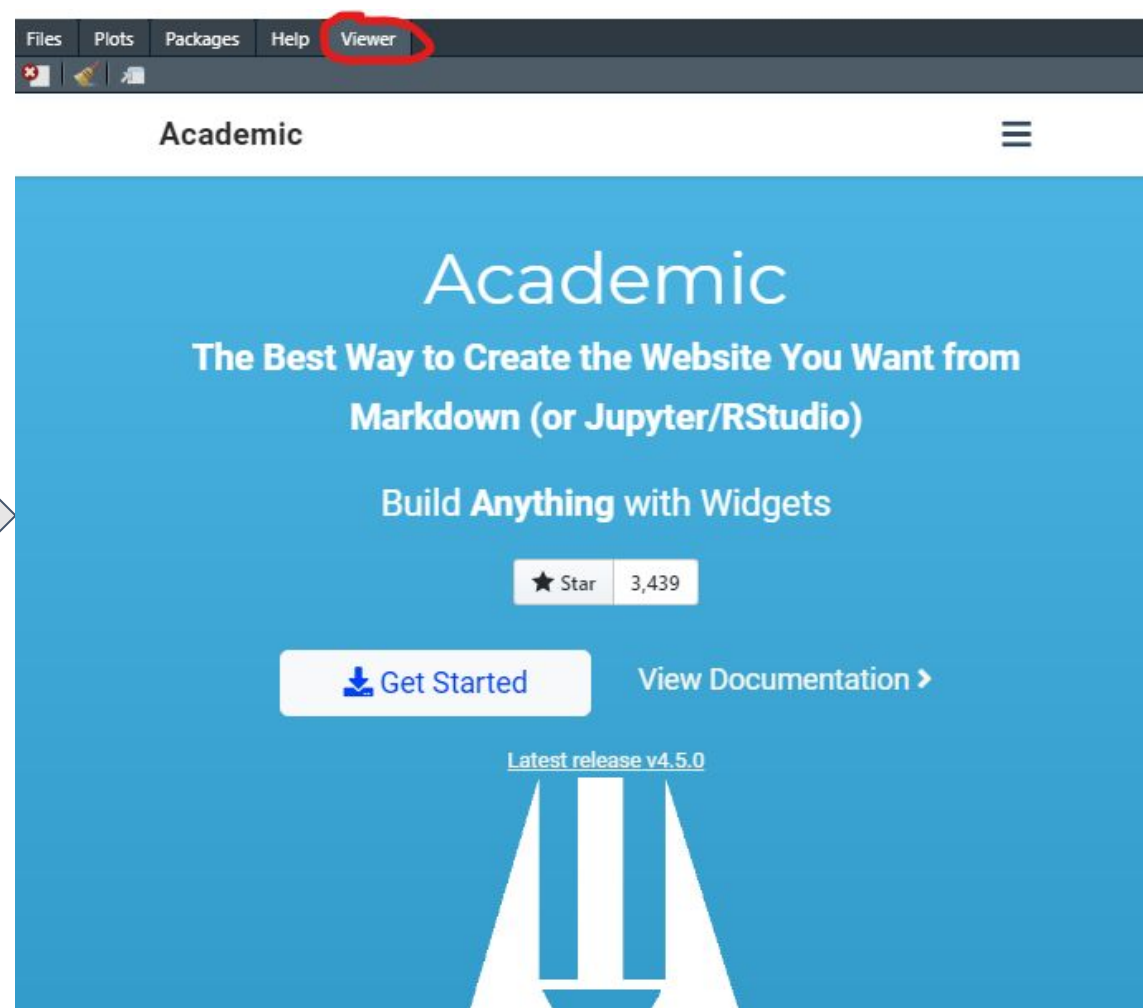

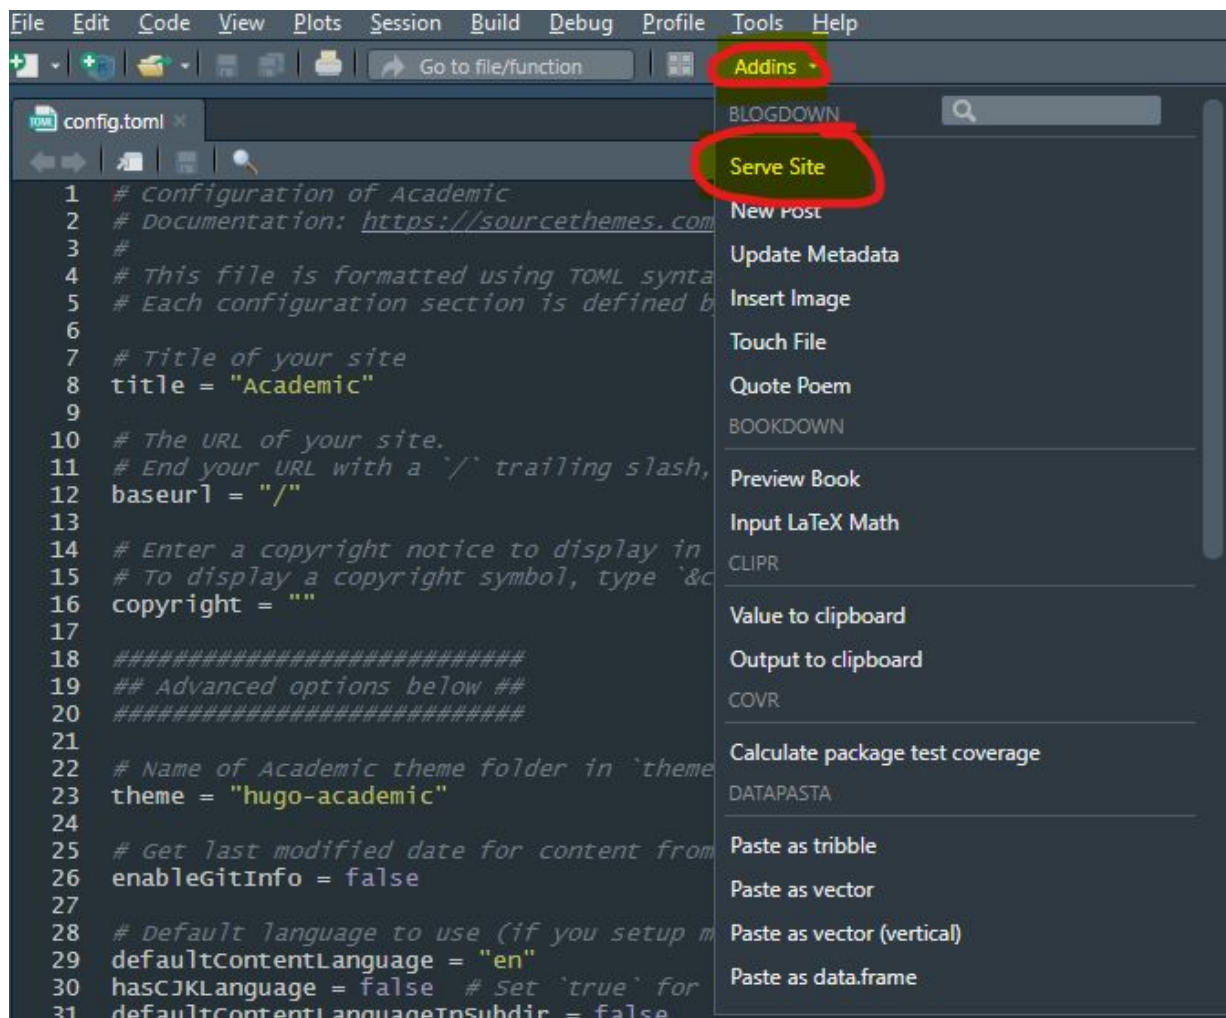

# RStudio

- Install blogdown: `install.packages("blogdown")`
- `blogdown::install_hugo()`

File -> New Project -> New Directory -> Website Using Blogdown

# RStudio

# Git Terminal

Tools -> New Terminal

Move to the folder where you saved the R Project:

**cd** *Your Path*

Write the following:

**echo "# test" >> README.md**

**git init**

**git add .**

**git commit -m "first commit"**

**git branch -M main**

**git remote add origin ## (link from Github repository)**

**git push -u origin main**

# Netlify

Go to: <https://www.netlify.com/>

- Login with your GitHub account
- New site from Git
- Select your website repo
- Deploy the site

## Create a new site

From zero to hero, three easy steps to get your site on Netlify.

1. Connect to Git provider 2. Pick a repository 3. Build options, and deploy!

### Continuous Deployment

Choose the Git provider where your site's source code is hosted. When you push to Git, we run your build tool of choice on our servers and deploy the result.

You can [unlock options for self-hosted GitHub/GitLab](#) by upgrading to the Business plan.

**GitHub** GitLab Bitbucket

## Create a new site

From zero to hero, three easy steps to get your site on Netlify.

1. Connect to Git provider 2. Pick a repository 3. Build options, and deploy!

### Continuous Deployment: GitHub App

Choose the repository you want to link to your site on Netlify. When you push to Git, we run your build tool of choice on our servers and deploy the result.

⚙ Site settings

⚙ Domain settings

## Domains

Use your own domain for your Netlify site for free

### Custom domains

By default, your site is always accessible via a Netlify subdomain based on the site name. Custom domains allow you to access your site via one or more non-Netlify domain names.

- [angry-kowalevski-c2053a.netlify.app](https://angry-kowalevski-c2053a.netlify.app)  
Default subdomain

[Learn more about custom domains in the docs](#)

Add custom domain

Options ^

Edit site name

# Make changes to the sample website

Change the name, posts, make changes and remember to:

```
git add .
```

```
git commit -m "message"
```

```
git push
```

# Get to know your site

- `config.toml`
- `content`
- `resources`
- `static`
